

## SKU Workflow — Focused Improvements

### The workflow remains unchanged

1. Create Master SKU
2. Add Colour child SKU
3. Add Size child SKU
4. Use the final Size SKU for inventory, sales, dispatch and forecasting

No additional approval, data entry, or workflow step is required.

### 1. Create Master SKU

**Keep:** Product name, model number, category, gender and HSN code.

#### Improve:

- Rename the preview field to **Generated Master SKU**.
- Keep it read-only; the system generates it live.
- Keep the right-side live code preview.
- Add one small note: **“Colours and sizes are added after the Master SKU is created.”**

### 2. Master SKU Pricing

**Keep:** Cost, selling price, MRP, retailer, distributor, e-commerce prices and GST.

#### Improve:

- Rename **Cost** to **Reference Cost**.
- Keep Selling Price, MRP and GST visible as the main fields.
- Put Retailer, Distributor and E-commerce Price under a collapsible heading: **Channel Price Overrides**.
- Let all child SKUs inherit these values by default.

This makes the page cleaner without removing any present functionality.

### 3. Review and Create

**Keep:** The existing final review step.

#### Improve:

- Show the final generated Master SKU prominently.
- Show a compact summary of product details and pricing.
- Add the note: **“After creation, add colour and size variants.”**

- Keep one clear blue action: **Create Master SKU**.

#### 4. Add Colour Child SKU

**Keep:** Select an existing colour or add a new colour with its short code.

**Improve:**

- Change the generated-code label to **Generated Colour SKU**.
- Show the parent clearly: **Created under Master SKU AD-M-HS-EH500**.
- Show inherited pricing in one compact row.
- Allow price changes only through an **Override price for this colour** link.
- Restrict adding new colour codes to authorised users or administrators.

#### 5. Add Size Child SKU

**Keep:** Size selection and system-generated child SKU.

**Important correction:**

- A size must always be created under the selected **colour SKU**.
- Do not allow a size to become the parent of another size.

**Improve:**

- Change the label to **Generated Sellable SKU**.
- Add a small visible note:  
**“This final SKU is used for inventory, sales, dispatch and forecasting.”**
- Keep prices inherited unless there is a deliberate override.

#### 6. Products & SKUs Catalogue

**Improve the display, not the process:**

- Show the hierarchy visually:  
**Master SKU**  
→ **Colour Variant**  
→ **Sellable SKU (Colour + Size)**
- Master SKU should show a summary, for example:  
**12 sellable variants · 8 in stock · 2 low stock · 2 out of stock**
- Only the final Sellable SKU should show:
  - On hand
  - Reserved
  - Available

- Low-stock / Out-of-stock status
- Add two simple tabs:
  - **Products** — shows Master SKUs and hierarchy
  - **Sellable SKUs** — shows final SKUs for stock, sales and dispatch work

#### **Design rules for every SKU screen**

- White background, pale blue-grey cards, dark navy text.
- One primary blue action button.
- Green only for active/available.
- Amber only for low stock/pending attention.
- Red only for out of stock, overdue or error.
- Avoid multiple coloured chips where plain text would work.
- Keep labels consistent: **Master SKU**, **Colour Variant**, **Sellable SKU**.
-
